                                                                                                                                                                     protein is designated E677etM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy terminus (where residues 24 and 26 have been replaced with glycine). E687TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

cc polypeptides from human papillomavirus type 16 (HPV16). The fusion comprising E6 and E7 crowner in is designated E6E7PentM, and comprises an E6 amino terminus cc (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy terminus (where residues 24, 26 and 91 have been replaced with CC glycine). E6E7PentM is representative of fusion proteins of the cc invention. The specification describes human papillomavirus E6 and E7 cc polypeptides, where the E7 polypeptide has mutations at any one or more cf the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has caids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus CC (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating conditionation treating the fusion proteins are useful for generating conditionation treating the fusion proteins are useful for generating conditionation treating the fusion proteins are useful for generating conditionation treating the fusion proteins are useful for generating conditionation treating the fusion proteins are useful for generating conditionation treating treating the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

                                                                                                                                                                                   The invention relates to a novel method for determining the possibility of recurrence of a (pre-)cancerous growth in a patient infected with human papilloma virus (HPV) or suspected of being infected with HPV, and has or had a (pre-)cancerous growth on or around the cervix. The novel method comprises incubating an E6 or E7 peptide of HPV with a sample from the patient, and assaying the sample for a cell-mediated immune response against the peptide. The method is useful for determining the possibility and preventing the recurrence of a (pre-)cancerous growth in a patient infected with HPV or suspected of being infected with HPV. The HPV E6 or E7 peptides are useful in immunotherapy for the preventing or reducing the risk of development of (pre-)cancerous growths. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a wild type E6 protein from human papillomavirus type 16 (HPV16), which is used to produce fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and mucleic acids encoding the fusion proteins are useful for generating jamunue responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human papillomavirus type 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                             Methods have been developed for distinguishing a subset of human CC papilloma virus (HPV) that is associated with an increased risk of C papilloma virus (HPV) that is associated with an increased risk of CC papilloma virus (HPV) that is associated with an increased risk of CC (1) preparing a cervical sample to expose any HPV-16 E6 gene in the CC sample and determining if the base at position 350 of the E6 gene (see CC AAT94723 and AAT94724 for comparison) is T or G, where the presence of GC at position 350 is associated with an increased risk of developing CC cervical dysplasia or cervical cancer; and (2) preparing a cervical sample to expose any HPV-16 E6 protein in the sample and determining if the amino acid at position 83 of the protein (see position 90 in AAW35741 and AAW35742 for comparison) is Val or Leu, where the presence of Val at CC position 83 that is associated with an increased risk of developing CC cervical dysplasia or cervical cancer. The present sequence represents the variant protein sequence for HPV-16 E6. The 350G variant correlates well with Pap scores: 350T:350G ratios among 45 HPV16 samples were 10:4 CC in negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for CIN III; CC 0:3 for cancer.                                                                                                                                                                              The present sequence represents an E6E7 fusion protein, comprising wild type E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.

                                                                                                                                                                                             The invention comprises a nucleic acid molecule (DNA vaccine) that encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E6 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecules encoding a fusion polypeptide comprising an antigen, a signal peptide, and a heat shock protein, useful as a vaccin for inducing or enhancing immune response or for inhibiting or preventitumor growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptide is the sequence of the human papillomavirus HPV 16 E6 nucleoprotein. Peptides corresponding to regions (pref. epitopic regions) of HPV 16 E6 were synthesised by standard Merrifield synthesis. Examples of such peptides are E6 1-20, 8-20, 119-134 or 148-158. Compositions contg. these peptides, antibodies against the peptides, or recombinant cells contg. the gene encoding the immuno-genic peptides may be utilised in methods for inhibiting and treating HPV infection and tumour initiation and progression e.g. in the prevention or retardation of cervical warts and cervical carcinoma resulting from HPV infection.                                                                                                                                                                                                                             The present invention describes an agent used in the treatment or prophylaxis of a disease caused or exacerbated by MPV (mammalian parphilomavirus) comprising a compound capable of reducing, inhibiting or otherwise decreasing the activity of a protein encoded by an MPV gene by facilitating disruption of a chelated metal cation domain present in the protein. An agent of the present invention can be used to treat cervical cancer or its HPV associated precursor lesions or other HPV associated cancers and/or warts. The present sequence represents a human papillomavirus E6 protein containing two zinc finger motifs, as given in the exemplification of the present invention
                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                            Polysulfide and dithionodisulfide agents, useful for the treatment prophylaxis of diseases caused by mammalian papillomavirus, are disruptors of a chelated metal cation domain in an MPV gene encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2000-256917/22

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated prepared human papillomavirus (C (HPV) epicope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the CC present invention are useful for stimulating an immune response to HPV by Stimulating the production of CTL or HTL responses, specifically in the CC treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides CC can also be used in a tetramer staining assay to assess peripheral blood CC mononuclear cells for the presence of antigen-specific CTLs following CC exposure to a pathogen or immunogen, and as reagents to evaluate immune CC compositions are useful for removing warts or treating HPV infections. CC The epitopes for inclusion in an epitope-base vaccine may be selected CC from conserved regions of viral or tumour-associated antigens, which CC reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of CC epitope-base vaccines. An additional advantage is the ability to combine CC epitopes achieving enhanced immunogenicity, the major benefit of the CC vaccine is that is safe and efficacious. AAB9331 to AAB9477 represent CC invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel purified complex comprising a first polypeptide and a second polypeptide, where the polypeptides comprise defined amino acid sequences listed in the specification, and where the first polypeptide binds to the second polypeptide. A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered jevel of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09500-ADF09583 represent proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing condition involving altered level of the complex e.g. human papilly virus infection, or cancer.

                                                                                                                                                                                                                                                                                                                                            The invention comprises a nucleic acid molecule (DNA vaccine) that encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MFC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E6 protein of the invention.

                                                                                                                                                                                                                                                          cc acid vector comprising a first sequence encoding an antigenit polypeptide or peptide, and optionally, a second sequence linked to the first corporation and indicate the first corporation of the sequence and encoding an immunogenicity-potentiating polypeptide (IPP); and a second nucleic acid vector encoding an anti-spoptotic polypeptide. When the second vector is administered with the first vector to a compression of the second vector is administered with the first vector to a competition of the second vector is administered with the first vector to a competition of the first vector alone. The invention further includes a particle comprising an anti-spopential that is suitable for introduction into a cell or an animal by particle composition; a pharmaceutical composition comprising the particle composition; an antigen specific immune response, comprising the particle and a carrier or an excipient; inducing or enhancing an antigen specific immune response of the numbers of CD8+ CTLs composition for a selected desired antigen in a subject; and inhibiting the composition of a tumor in a subject. The nucleic acid composition is useful as an immunogen for inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as an immunogen for inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as compositatic activity. This sequence represents ananti-apoptotic vector HPV composition of the invention.

                                                                                                                                                                                                                                                 S
                                                                         밁
                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antibody composition comprising a mixture of monoclonal antibodies that specifically bind to 86 proteins of human papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one of the monoclonal antibodies specifically binds to 86 proteins of at CC diagnostic kit (for detecting an HPV strains. Also included are a diagnostic kit (for detecting an HPV strains. Also included are a comprising the antibody composition above), a method of detecting an HPV CC protein in a sample, a method of detecting the presence of an concegenic HPV 86 protein in a sample and a system for detecting a HPV CC presence of an oncogenic HPV 86 polypeptide in a sample (comprising a first and a second binding partner is a PDZ domain protein and the second binding partner is a PDZ domain protein and the second binding partner is an antibody that specifically binds to the 86 proteins of at least three different oncogenic HPV strains). The antibody composition, kit, methods, and system are useful for diagnosing cancer, particularly cervical cancer. The present sequence is an HPV E6 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of producing a synthetic protein comprising an amino acid sequence that is at least 80% identical to a comprising an amino acid sequence that is at least 80% identical to a comprising antigenic protein of a pathogen or tumor comprising chemically synthesizing two or more fragments, chemically ligating the C-terminus of a fragment to the N-terminus of a neighboring fragment to composition or its part and optionally repeating the composition of the synthetic protein or its part and optionally repeating the composition comprising the protein and a method for treating or composition comprising the protein and a method for treating or composition comprising the protein and a method for treating or composition in a therapeutically effective amount. In producing a synthetic protein, the neighboring non-overlapping fragments are selected to comprise N-terminal cysteine or glycine cresidues. The naturally occurring protein is an HPV protein, e.g. E2, E6 or E7 protein from HPV16, HPV13 HPV33 or HPV45. The composition of useful as a concer. This sequence represents an HPV16 E6 protein used in the method confiction is useful as a confict of the invention.

                                                                           multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the E1, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchox/spacer paptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chesnut Chen Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 10; Page 349; 518pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2005-658982/67.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a defense is an HPV protein used to derive epitopes for the vaccine of the
The present invention relates to novel fusion protein for inhibiting on preventing cancer induced by human papillomavirus type 16 (HPV16). The fusion protein comprises an E7 peptide sequence of human papillomavirus type 16, a translocating peptide for translocation and a peptide fragme
                                                                                                                            New fusion protein comprising E7 peptide sequence of human papillomavirus type 16, useful for inhibiting or preventing cancer, e.g. cervical or lung cancer.

The fusion protein of the is useful as vaccines and for inhibiting or preventing human papillomavirus infection and canners such as cervical and lung The invention is useful in gene therapy. The present sequence in human papillomavirus type 16 (HPVI6) E7 protein.
     Methods have been developed for distinguishing a subset of human pagilloma virus (HPV) that is associated with an increased risk developing cervical dysplasia or cervical cancer. The methods in (1) preparing a cervical sample to expose any HPV-16 E6 gene in the sample and determining if the base at position 350 of the E6 gene
                                                                                                                                                                                              Evaluating risk of cervical dysplasia or cervical cancer -variant form of human papilloma virus 16. \,
                                                                                                                                                                                                                                                                                                                                                                                                                                            28-SEP-1993;

The present sequence represents the reference protein sequence for HPV-16 E6. The 350G variant correlates well with Pap scores; 350T;350G ratios among 45 HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for CIN III; 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)
The invention relates to a new DNA sequence encodes an E6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced by codons which lead to enhanced translation in a mammalian cell, containing

The invention is used as a vaccine for the prevention or reatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the human papillomavirus-16 (HPV16) EEGT-protein sequence of the invention
   The sequences of the E6 papillomavirus (HPV) 16 proteins in AAR63865-66,

The present sequence represents a fusion protein, comprising E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E7E6TetM, and comprises an E7 amino terminus (where residues 24 and 26 have been replaced with glycine) and an E6 carboxy terminus (where residues 63 and 106 have been replaced with glycine). B7E6TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of
                                                                                                                                                                                                                                                            New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human papillomavirus Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences were used for HPV infection diagnosis; expression of E6 and diagnostic for cervical cancer or pre- malignant states. (Updated c 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardi OS field)
                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                    Smith

The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E7E6PentM, and comprises an E7 amino terminus (where residues 24, 26 and 91 have been replaced with glycine) and carboxy terminus (where residues 63 and 106 have been replaced with glycine). E7E6PentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and I

replaced with

B7

an

E 6

The present sequence represents a fusion protein,

comprising

87

New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

E7 polypeptides, (HPV)-associated

The polypoptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                         Virus-like particle vaccines containing dengue as core for carrier, applicable in preventives like cervical cancer and viral diseases.

```

A dengue virus recombinant replicon has a

deletion of the complete coding

producing a drug for the prophylaxis and treatment of cancer or vi

viral

producing a drug infection.

Example 2;

SEQ ID NO 2; 38pp; Chinese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to the HPV type 16 E7 protein whose encoding gene is used as the gene of interest in the recombinant replicon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NS1 protein signal, coding regions of all non-structural proteins. The obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; virus-like particle; replicon; therapeutic; cancer; cytostatic; neoplasm; viral infection; virucide; infection; oncoprotein.

The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncoprotein.
                                             Recombinant virus vectors encoding human papillomavirus proteins - for treating and vaccinating against HPV infections and conditions caused them, such as cervical cancer.

The prod. of the third reading frame is the HPV-16 E6 protein whereas the second reading frame encodes HPV-16 E7. The E6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherspeutically to activate cells of the immune system against HPV.                            AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX28375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce ar immune response in a patient to an HPV antigen. They can also be used f preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preferably a deletion mutant comprising at least half, and preferably two rethirds of full length E6 or E7 protein starring from the N- or C- terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence is a full length E6/E7 fusion protein. (Updated on 27-AUG-2003 to correct OS field.)

                                                              This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                 AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fusion protein; E6 protein; E7 protein; E6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Streptococcus gneunoniae CLYTA protein of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.
